Boss delays with reverse modes

QUOTE

by charmonder » 09 Jan 2014, 21:53

I noticed the DD-5's panning output works even in the reverse mode, makes a really cool stereo effect. Turns out I can't get the same thing with GT-100.
For anyone that has DD-6, DD-7 or DD-20 handy, will these still do a "panning" output in reverse mode? I looked at the manuals but I couldn't find a definite answer. Thanks for any help!

I'll try in a moment, but I guess so. The panning function is available in every delay type as soon as you make the right connection, isn't it?

Well, tests done. The DD-20 doesn't pan at all when stereo outputs are plugged, except in... Pan Mode. Quite limiting.
The DD-7 pans everything everytime, and it's just gorgeous. I did some test with my Strymon Timeline as well, and I must say this one is panning in some modes, but not all, and the panning is lower

Thanks for the quick reply Bruno! In that case I'm going to be looking for the DD-7 or DD-6.

There is one other difference I'm looking for (if you care to investigate!)
this:
1) With DD-5, I remember adding feedback introduces forward sounds in the repeat trail.
2) with the GT-5 and GT-100 reverse delay, all repeats are reverse direction regardless of the feedback setting (& for some reason this sounds very wrong to my ears!)

It's hard to pick out from the demo clips but I think the DD-20 has the alternating reverse/forward style repeats like DD-5. I can't tell for sure, can anyone say how the DD-6, DD-7 or DD-20 reverse feedback is?

Not sure i clearly understand your point #1. Do you mean self oscillation noises? In this case, yes it self-oscillates when feedback is maxed all the way.

For your #2 question, if i understand it correctly (sorry but english is not my native language), the repeats are all reversed, indeed, BUT on the DD-7, the "tracking" is more accurate to my ears than on the DD-20. Not sure it works as you would want
