If you own a DingoTone BSD, here's a mod for it

by **Laurie** » 06 Jul 2016, 13:41

I've been fiddling with my personal BSD... can't help myself!

If you change R17 to 15k (it is 56k stock) it will open up the highs a little and let the pedal breathe a little easier. If that's the kind of thing that you might like...

What are you calling the mod?

LSD?

IF ... I was still building the BSDs, it would just become part of "V2".

Dunno that it needs a "name"...

Worth putting on a toggle? Or does the bax stack provide enough flexibility to manage the new-found highs?

I knew there was a reason I grabbed more than one of these

No need for a toggle.

For my mod I put a 22k on the back of the board in parallel with the 56k. Need to take care it is close to the board but not shorting to it (so it will have clearance to the pedal base). Saves dismantling the pedal.

I like the BSD as it is. I don't think that I want to try out this mod.

I might try that. Would it effectively decrease the gain on the bass notes? Give that impression I mean..
